

DINAMIX SMX NEW SIDE-ENTRY AGITATOR

INOXPA announces the launch of the new DINAMIX SMX side-entry agitator.

A wide range of fully adaptable and modular models with different options will be available to meet our customers' needs in the different industries where these types of agitators can be installed.

Main features:

- Stainless steel lantern
- Parallel shaft or worm gear drive
- More efficient Gamma propeller
- Standardised EN 1092-1 type 01 PN 10 flange
- Option of an agitator without lantern
- Optional hygienic design
- ATEX certification

This new design meets the current needs and technical demands in the sector and replaces the current agitator. It comes with a standardised flange, stainless steel lantern and a design that offers numerous different configurations.

The range is now larger with one smaller and two bigger supports. This means a lower power consumption, smaller, application-suitable agitator can be installed, and that the same agitator can be used for large volumes.

This new product represents an important and strategic change within the agitation category, driving and developing the modular concept.

This adaptable system uses standard components to produce many different configurations, avoiding the need to manufacture made-to-measure agitators.

The strengths of this concept are based on adaptability, responsiveness and efficiency.

The technical data sheet, the instruction manual and the price list are available for the new side-entry agitator. The sales team will also be given technical-sales training on the product.

For further information, please contact David Vila dvila@inoxpa.com, product manager for agitation and mixing.
